Die Niederschläge im Oktober 1940.

Allgemeine Übersicht: Der Oktober war mit wenigen Ausnahmen, besonders der Gebiete am Süd- und Ostrande der Alpen zu trocken.

Während zu Anfang des Monats der größte Teil des Reiches unter der Wirkung des von West nach Ost sich erstreckenden Hochdruckrückens heiteres Wetter hatte, war das Alpengebiet bei stärkeren Niederschlägen (teilweise 20 mm) von einem Mittelmeertief beherrscht. Bei langsamer Ausbreitung des Tiefs über Mitteleuropa griffen die Niederschläge am 2. nach Süddeutschland, am 3. nach dem Norden des Reiches über. Der Kern der Depression verlagerte sich mit einem Regengebiet am 4. wieder stark nach Süden und weiter nach Ungarn, so daß die Ostmark noch Tagesmengen bis zu 33 mm verzeichnete. Die Annäherung einer nordatlantischen Sturmzyklone, die am 7. nach dem Belt, dann nach Nordosten sich verlagerte, brachte mit dem Vorstoß subtropischer Warmluft erneut Niederschläge, die sich vom 5. zum 7. von Nordwestdeutschland über das Reich verbreiteten und am 8. noch im Alpengebiet sich auswirkten. Bei stärkerer Trübung im Nordwesten des Reiches, die am 9. und 10. durch Randstörungen einer Atlantikzyklone veranlaßt war, herrschte sonst ein wechselnder, wenn auch vielfach heiterer Witterungscharakter vor. Flache Teiltiefs wanderten am 11. und 12. vom Mittelmeer nach Norddeutschland und führten den westlichen Gebieten des Reiches Niederschläge zu, die vereinzelt 30 mm betrugten. Bei langsamem Ausgleich der Druckunterschiede gewann das osteuropäische Hoch immer mehr an Einfluß; mit dem 13. etwa setzte herbstlich antizyklonales Wetter mit weitverbreiteten Morgennebeln in ganz Mitteleuropa ein. Der heitere herbstliche Witterungscharakter ohne nennenswerte Niederschläge hielt etwa bis zum 24. an und wurde nur im Nordwesten am 17. und 18. bei Annäherung einer atlantischen Druckstörung durch vorübergehende Trübung und Regen unterbrochen. Die Verschärfung der Druckgegensätze gegenüber einem Biskayatief ließ bereits bei der von Nordost vordringenden Kaltluft im Laufe des 23. starke Bewölkung aufkommen. Vereinzelt und strichweise trat leichter Regen ein, der vom 25. ab im Alpengebiet zu sehr reichlichen Niederschlägen überging (bis 48 mm), als eine okkludierende Teilstörung von Oberitalien her am Ostalpenrande erschien, und nachfolgend auf gleicher Bahn am 26. eine ausgedehnte Depression ostwärts zog. Die anhaltende Zufuhr verschieden temperierter Luftmassen bedingte eine erhöhte Niederschlagsbildung und führte dazu in der südlichen Reichshälfte selbst in den tieferen Lagen verbreitete Schneefälle herbei. Im Alpenlande hielten noch am 28. und 29. die Niederschläge an, während über Mitteleuropa das durch Kaltluftzufuhr und absinkende Luft entstandene Hoch weitgehende Aufheiterung veranlaßte. Erneut am Ostalpenrande auftauchende Mittelmeertiefs bewirkten am 30. in der südlichen Hälfte des Reiches bei kalten Nordostwinden nochmals reichliche Niederschläge in Form von Schnee. In Norddeutschland dagegen blieben, wie schon in der gesamten letzten Monatsdekade, die Niederschläge äußerst gering.

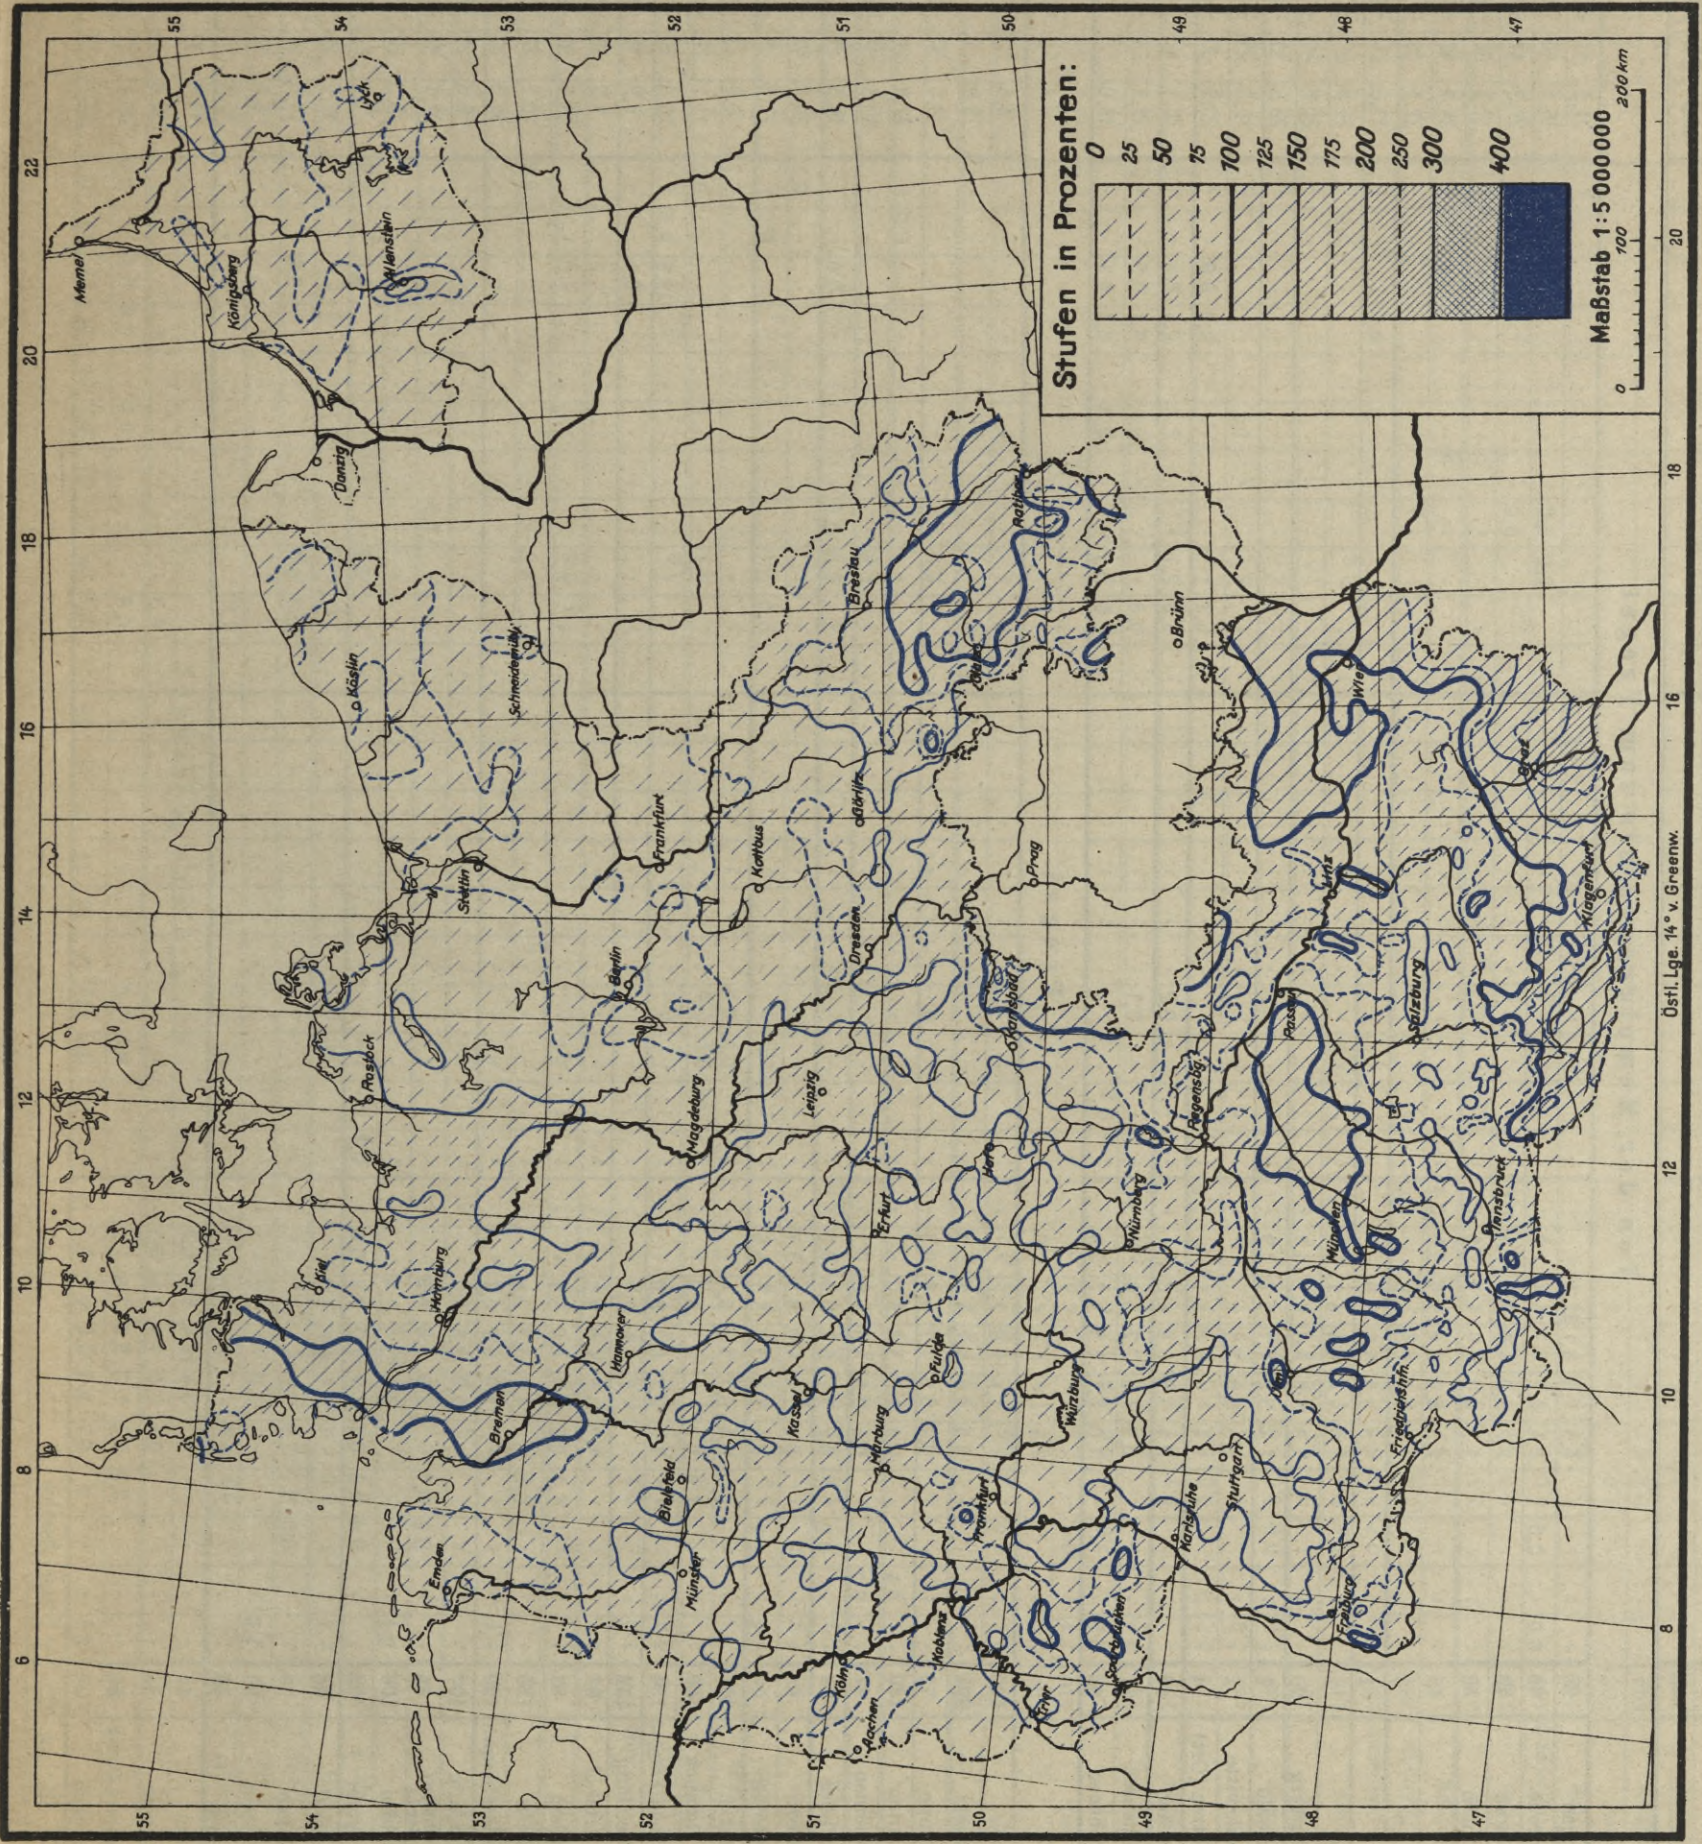

Die Gesamtbeträge im Oktober blieben recht gering, obwohl an einzelnen Tagen in Süddeutschland und in der Ostmark größere Mengen gefallen waren. Weniger als 25 mm wurden im östlichen und mittleren Norddeutschland verzeichnet, weniger als 10 mm im größten Teil von Ostpreußen und Pommern. Etwa 50—100 mm hatten Schleswig-Holstein und Oldenburg, kleinere Gebiete Westdeutschlands, ferner das südliche Schlesien; auf mehr als 50 mm stiegen auch die Monatsbeträge südlich der Donau, um an den Hängen der Alpenkette auf mehr als 75 mm zuzunehmen. Beträge über 100 mm hatten nur das südliche Kärnten und Steiermark, solche von mehr als 200 mm die Höhen der Karawanken.

Im Vergleich zu den langjährigen Durchschnittswerten war fast das ganze Reichsgebiet erheblich zu trocken. Unter 25% blieben die Niederschlagsbeträge in großen Teilen von Pommern und Ostpreußen und hielten sich auch im größten Teil des Reiches zwischen 25 und 75%. Die Normalwerte wurden überschritten im gesamten Gebiet südlich der Zentralalpen, wo im Grazer Becken sogar mehr als das Doppelte verzeichnet wurde.

Entsprechend den Niederschlagsmengen blieb auch die Zahl der Tage mit Niederschlag im ganzen Reich um 1—8 Tage gegenüber den Erwartungen zurück, namentlich im Küstengebiet. Zu hoch war die Niederschlagshäufigkeit nur in der südlichen und östlichen Ostmark und im Sudetengebiet. Gewitter wurden vereinzelt in Königsberg, in Teilen Schlesiens und Sachsens, sowie im südöstlichen Teil der Ostmark beobachtet. Schneefall, der im Küstengebiet und im Rheinland noch ausblieb, trat im norddeutschen Binnenland durchweg an 1—5 Tagen auf, in Süddeutschland und in der Ostmark an 5—8 Tagen, auf den Berggipfeln an 10—18 Tagen. Dabei hielt sich die Schneedecke in den Gebieten mit Schneefall je nach der Höhenlage nur an 1—6 Tagen; eine während des ganzen Monats andauernde Schneedecke wurde nur vom Sonnblick gemeldet.

Erläuterungen zu den Tabellen: Es bedeutet: ein Punkt, daß kein Niederschlag gefallen ist; 0,0, daß die Menge unmeßbar (unter 0,05 mm) war; ein Strich, daß eine Messung nicht ausgeführt wurde; ein schräger Strich in der oberen rechten Ecke, daß eine Schneedecke um 7^h vorhanden war; diese Eintragung erfolgt aber nur bei Stationen, die regelmäßige Messungen der Schneedecke (☒) durchführen und an der Eintragung eines Wertes in der letzten Spalte kenntlich sind. — Der Berechnung der Prozente des Normalwertes und der Abweichung vom Normalwert sind die Mittelwerte 1891—1930 zugrunde gelegt. — Als Tage mit Schnee (☒) wurden alle Tage gezählt, an denen der Niederschlag von Schnee oder von Regen und Schnee herrührte und die Tagesmenge mindestens 0,1 mm betrug, als Tage mit ☒ die Tage, an denen um 7^h eine Schneedecke lag, für Punkt und Strich gelten die vorstehenden Erklärungen entsprechend. — Eingeklammerte Werte () sind ergänzt. — Eine Zahl unter einer Klammer (—) gibt die Gesamtmenge mehrerer Tage.

Im vorliegenden Bericht werden die täglichen und Monatsmengen des Niederschlags von nur einem Teil der im Deutschen Reich vorhandenen Stationen veröffentlicht. Die Monats- und Jahresmengen von sämtlichen Stationen können dem später erscheinenden Schlußheft des Deutschen Meteorologischen Jahrbuchs 1940, Teil III, entnommen werden.
