### Vorwort.

Vorliegendes Werk soll hauptsächlich für die Tracirungsarbeiten bei der Projectirung und dem Bau von Eisenbahn- und Wegelinien dienen. Dem Techniker und besonders dem Eisenbahn-Ingenieur soll damit eine Sammlung von Tafeln, welche für alle vorkommenden Arbeiten und alle gewöhnlich zur Anwendung gelangenden Methoden genügt, in die Hand gegeben werden.

Sämmtliche Tafeln sind genau und vollständig von uns gerechnet und sollten nach wiederholter Durchsicht keinerlei Fehler mehr enthalten.

Gegenüber schon bestehenden kleineren Tafelsammlungen zum Gebrauch bei Curvenabsteckungen sind einige Vorzüge unserer Tafeln zu erwähnen.

Währenddem Kröhnke, Morawitz etc. nur einzelne Methoden der Curvenabsteckung aufgenommen haben, sind bei unsren Tafeln alle gegenwärtig zur Anwendung kommenden Verfahren berücksichtigt. Kröhnke giebt ferner Tangentenlängen, Bogenlängen etc. nur für die Tangentwinkel von  $60^\circ$  bis  $180^\circ$  und nur von 2 zu 2 Minuten wachsend, wir aber von  $50^\circ$ — $180^\circ$  und von Minute zu Minute wachsend, weil Winkel von  $50^\circ$ — $60^\circ$  bei Bergbahnen nicht zu den Seltenheiten gehören und weil wir alle Tangentwinkel innerhalb der erwähnten Grenzen, soweit dies praktisch und nothwendig ist, berücksichtigen wollen.

Bei der dritten Tafel haben wir zum Behufe successiver Anlegung neuer Tangentenabscissen den der jeweiligen Bogenlänge entsprechenden Werth von Secant externae angegeben, was besonders bei Absteckung grösserer Bogenlängen eine nicht unwillkommene Zugabe sein wird.

Die Tafeln zur Reduction der schießen Längen auf den Horizont für Distanzmessung und die Tangententafel für Höhenmessung sind nach einem Schema von Prof. Wild am eidg. Polytechnikum in Zürich gerechnet und basiren sich auf die theore-

tischen Ausführungen in Stampfer's Anleitung zum Nivelliren pag. 85—88, neueste Ausgabe.

Hervorheben müssen wir, dass Uebergangs-Curven nach Baudirector Thommen, wie sie an der Brenner-Bahn allgemein Anwendung gefunden und sich praktisch bewährt haben, mit den vorliegenden Tafeln bequem abgesteckt werden können. Näheres über dieses praktische Verfahren der Einschaltung von Kreissegmenten mit sich successive verdoppelnden Radien findet man im Organ für die Fortschritte des Eisenbahnwesens, 1865, pag. 158, und in der schweizerischen polytechnischen Zeitschrift, 1864, pag. 129.

Tafeln zur Absteckung von complicirteren Uebergangs-Curven haben wir nicht aufgenommen, da wir einestheils der Ansicht sind, dass solche weniger Anwendung finden werden und am Besten während des Baues, nicht schon bei der Tracirung einzulegen sind. Anderntheils ist bekannt, dass die meisten Eisenbahn-Baudirectionen Instructionen für den Bau-dienst herausgeben, in welchen das Einschalten von Uebergangs-Curven, als auch die Ueberhöhung des äussern Schienenstrangs und die Spurerweiterung in Curven, wie auch die Vermittlung der Gefällwechsel mit detaillirten Zahlenangaben in Tafeln berücksichtigt werden.

Begründete Begehren von Seite der Berufsgenossen, betreffend allfällig mögliche Verbesserung und Vervollständigung des Inhaltes unseres Handbuches, werden von uns mit Dank entgegengenommen und nicht unbeachtet gelassen werden.

Die uns befreundeten Collegen begrüssten lebhaft die Inangriffnahme dieser Arbeit; wir hoffen auf gleich wohlwollende und günstige Aufnahme unserer Tafelsammlung von Seite der gesammten Berufsgenossenschaft.

Winterthur und Zürich, im December 1872.

**H. Hanhart. A. Waldner.**

Anmerkung: Sämmtliche Tafeln sind für alle Maass-Systeme zu gebrauchen.

# Inhalt.

---

|  | Seite |
|--|-------|
| Vorwort . . . . .  | V     |
| Tafeln der Tangentlängen, der Abstände von<br>Tangentwinkelpunkt und Bogenmitte, der<br>Abstände von Sehne und Bogenmitte, der<br>halben Sehnenlängen, der Bogenlängen für<br>alle Tangentwinkel von $50^\circ$ — $180^\circ$ oder<br>Centriwinkel von $0^\circ$ — $130^\circ$ , von Minute zu<br>Minute wachsend, für den Radius 100 be-<br>rechnet . . . . . | 1     |
| Tafeln zum Abstecken von Curven mittelst<br>Winkelinstrument und Standort in der<br>Curve . . . . .  | 267   |
| Tafeln zum Abstecken von Curven mittelst<br>Ordinaten von der Tangente als Abscisse<br>aus . . . . .   | 311   |
| Tafeln zum Abstecken von Curven mittelst der<br>Methode der successiven Sehnen . . . . .   | 359   |
| Gefällswinkel-Tafeln . . . . .   | 367   |
| Reductions-Tafeln für Distanzmessung und Tan-<br>genten-Tafel für trigonometrische Höhen-<br>messung . . . . .   | 373   |

## **Tafel**

enthaltend die Werthe der Tangentlänge, des Abstandes von Tangentwinkelpunkt und Bogenmitte, des Abstandes von Sehne und Bogenmitte der halben Sehnenlänge der Bogenlänge für den Radius 100 und für die Tangentwinkel von  $50^\circ$  bis  $180^\circ$  oder Centriwinkel von  $0^\circ$  bis  $130^\circ$  von Minute zu Minute wachsend.

---

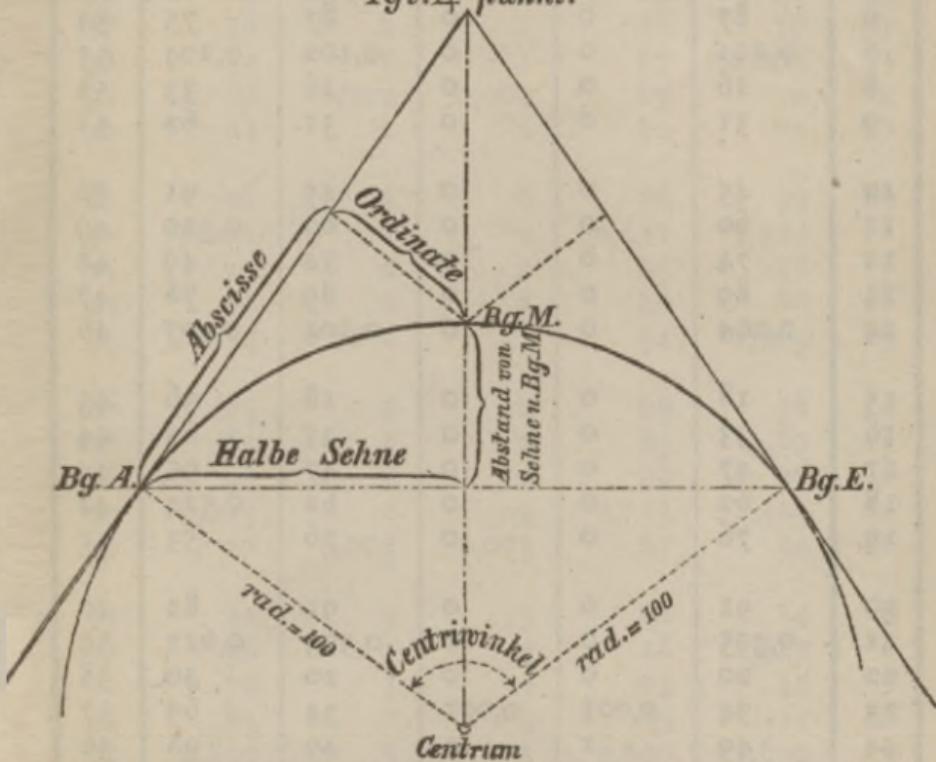

Um die entsprechenden Längen für andere Radien als den angenommenen Radius 100 finden zu können, genügt die Angabe, dass diese Längen in ihrem Werthe immer proportional den betreffenden Radien sind; nur müssen sie natürlich ein und demselben Winkel angehören.

Zum Beispiel wird die Grösse  $x$  für den Radius 500 gesucht, ist  $x$  aus folgender Proportion zu entnehmen:

$$100 : 500 = \text{Tabellenwerth: } x \text{ etc.}$$

Tgt.  $\chi$  punkt.

Halbe Sehne = Abscisse von Bg.-M.

Abstand von Bg.-M. und Sehne = Ordinate von Bg.-M.

Anmerkung. Da die trigonometrischen Functionen für den halben Centriwinkel folgenden Grössen für den ganzen Centriwinkel gleich sind:

$\sin \dots \dots \dots =$  halbe Sehne,

$\sin \text{ vers} \dots \dots \dots =$  Abstand von Sehne zu Bogenmitte,

$\sec \text{ ext} = (\sec - 1) =$  Abstand von Tangentwinkel-punkt und Bogenmitte,

$\tan \dots \dots \dots =$  Tangentenlänge,

können diese Tafeln auch als  $\sin$ ,  $\sin \text{ vers}$ ,  $\sec \text{ ext}$  und  $\tan$  Tafeln benutzt werden.

Centriwinkel  $0^\circ$ .

## **Tafeln**

zum Abstecken von Eisenbahn- und Wege-Curven mittelst  
Winkelinstrument und Standort in der Curve, für Radien  
von 50 — 5000.

---

Die Methode der Curvenabsteckung mittelst Winkelinstrument vom Kreisumfang aus ist das einzige Verfahren, welches erlaubt, Kreisbogen ebenso schnell und ebenso sicher und genau wie gerade Linien abzustecken. Diese Methode ist im allgemeinen Gebrauch in den Vereinigten Staaten von Nordamerika und soll im Jahre 1829 von Colonel Stephen H. Long in seinem Railroad Manual zuerst veröffentlicht worden sein. Für England nimmt William John Macquorn Rankine den Vorrang in der Veröffentlichung obiger Absteckungsmethode in Anspruch und zwar soll das im Jahre 1843 geschehen sein. Aehnliche Tabellen wie die vorliegenden finden sich schon seit Jahren in englischen Ingenieur-Handbüchern. Für Deutschland hat Eisenbahninspector Morawitz Tafeln zum Gebrauche bei diesem Verfahren herausgegeben; dieselben enthalten aber durchgehends für Winkel von grösseren Bogenlängen allerdings für die Praxis nicht in's Gewicht fallende fehlerhafte Angaben, wie z. B.  $\text{tg } \angle$  für 50 Bogenlängeneinheiten für Radius 50 aus folgender Proportion

$$2 r \pi : 1296000'' = 50 : 2 x$$

sich ergibt  $x = 28^\circ 38' 52''.4$ , in Morawitz fehlerhaft  $28^\circ 39' 0''$ , ferner  $\text{tg } \angle$  für 100 Bogenlängeneinheiten für radius 200 aus Proportion

$$2 r \pi : 1296000'' = 100 : 2 x = 14^\circ 19' 26''.2,$$

in Morawitz fehlerhaft  $14^\circ 19' 30''$  u. s. f.

Die Curvenabsteckung mittelst Winkelinstrument vom Kreisumfang aus fusst auf dem bekannten Satze, dass der Peripherie- oder hier der Tangent-Sehnen-Winkel eines Bogens gleich der Hälfte des zugehörigen Mittelpunktwinkels ist.

Für verschiedene Halbmesser und verschiedene Bogenlängen sind in den Tafeln die zugehörigen Tangent-Sehnen-Winkel angegeben, welch letztere beim Abstecken benutzt werden.

Bogenanfang, Bogenmitte oder Bogenende, genau mit Winkelinstrument bestimmt, können als Hauptstandpunkte am Besten zum Abstecken der anderweitigen Bogenpunkte benutzt werden. Bei grosser Länge der Curve muss entweder von Bogenmitte oder sowohl von Bogen-Anfang als auch von Bogenende aus abgesteckt werden, wenn mit Genauigkeit gearbeitet werden soll.

Die Entfernung der einzelnen Bogenpunkte, z. B. 10<sup>m</sup> oder 20<sup>m</sup>, darf dem jeweiligen Halbmesser entsprechend so angenommen werden, dass Sehne und Bogen in dieser Länge keinen merklichen Unterschied zeigen, was aus folgender Gleichung leicht entnommen werden kann:

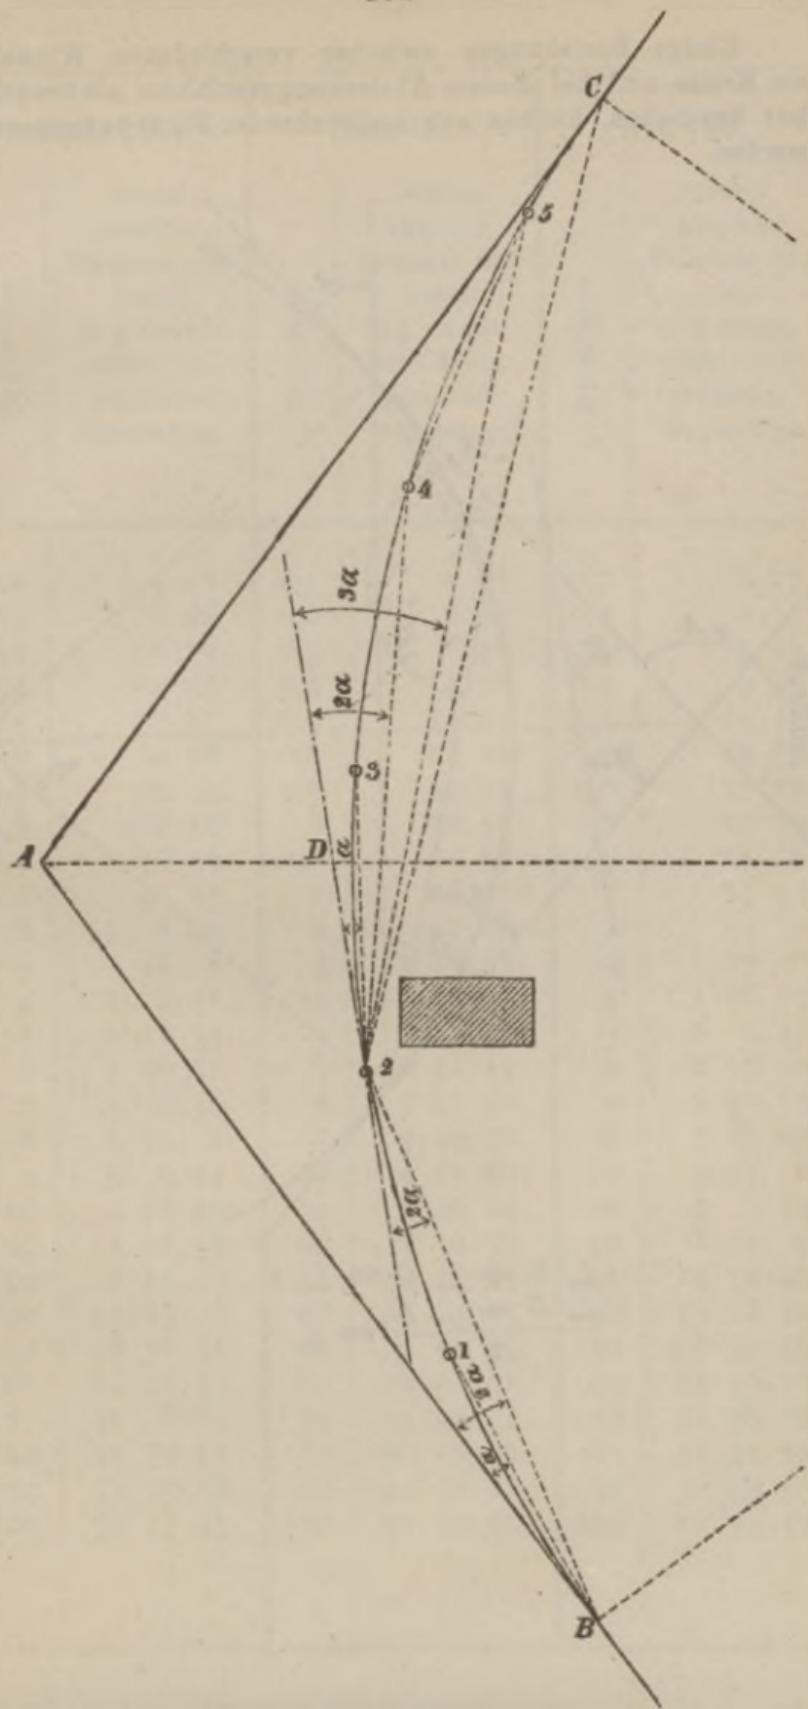

$$\text{Sehne annähernd} = \text{Bogen} \left( 1 - \frac{\text{Bogen}^2}{24 \text{ rad}^2} \right).$$

Um nun zu zeigen, wie beim Abstecken verfahren wird, bezeichne in nachfolgender Figur (S. 271) *B* Bogenanfang, *D* Bogenmitte, *C* Bogenende. Das Winkelinstrument wird z. B. in *B* aufgestellt, die Visur der Tangente genommen, und der Winkel, welcher der gewählten Entfernung *B* 1 der Bogenpunkte entspricht, angeschlagen. Zu gleicher Zeit messen die Gehülfen diese Entfernung *B* 1 auf dem Felde ab; wo Ende von Distanz und Visur *B* 1 zusammentreffen, liegt der Punkt 1 des Bogens. Für die Bestimmung von Punkt 2 wird zu Winkel *AB* 1 ein Winkel von derselben Grösse zugeschlagen, eine weitere gleiche Distanz von 1 aus eingemessen und Punkt 2 da gefunden, wo Ende der zweiten Distanz und Visur *B* 2 zusammentreffen u. s. w.

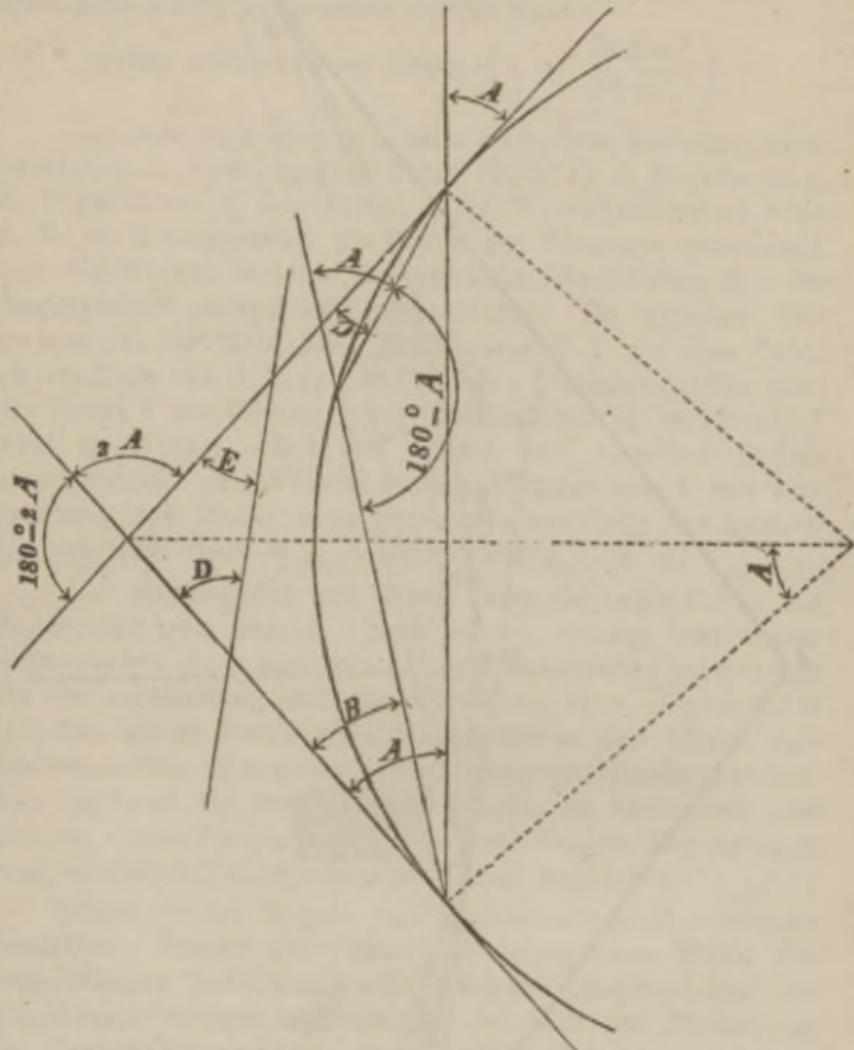

Auf dieselbe Art und Weise lässt sich eine Curve aus Bogenmitte oder irgend einem andern richtig bestimmten Bogenpunkte abstecken, wie das nothwendig sein wird, wenn die Bodengestaltung etc. das Einvisiren aller Bogenpunkte von den zuerst bestimmten Hauptpunkten der Curve verhindern sollte. An einem jeden Instrumentstandort ist einfach die Lage der zugehörigen Tangente zu bestimmen und sind an diese Tangente die den betreffenden Bogenlängen entsprechenden Tangent-Sehnen-Winkel anzulegen.

Selten werden Bogen- und Stationirungspunkte zusammenfallen. Immer aber kann auf angegebene Weise die entsprechende Entfernung vom nächsten Bogenpunkte aus eingemessen werden und alsdann ist blos der Winkel an die Tangentrichtung im Instrumentstandpunkt anzulegen, welcher der Distanz von diesem Punkte aus bis zum zu bestimmenden Curvenpunkt entspricht, um dessen Lage mit der Visur zu finden.

Die Winkel müssen mit grosser Genauigkeit gegeben werden. Ein Fehler von 1 Minute veranlasst eine falsche Einstellung von 0,00029 mal Entfernung, was für 200<sup>m</sup> schon 5,8<sup>cm</sup> ausmacht. Die Entfernung der Instrumentstandorte von einander sollte der mehr oder weniger genauen Theilung des Horizontalkreises entsprechend angenommen werden.

Einige Beziehungen zwischen verschiedenen Winkeln am Kreise und bei diesem Absteckungsverfahren als brauchbar anzusehen, können aus nachstehender Figur entnommen werden.

$$\begin{aligned}\angle B + \angle C &= \angle A \\ \frac{\angle D + \angle E}{2} &= \angle A\end{aligned}$$

## **Tafeln**

zum Abstecken von Curven mittelst Ordinaten von der  
Tangente als Abscisse aus, für Radien zwischen  
10 und 3000.

---

Die Tangente bei Bogenanfang wird als gegeben vorausgesetzt; die in den Tafeln angegebenen Abscissenlängen werden darauf abgemessen und jeweils die entsprechenden Ordinatenlängen senkrecht auf die Tangente angelegt. Sind

Bogenanfang und Ende gegeben, wird vortheilhaft von beiden Fixpunkten gegen die Mitte zu gearbeitet. Für Stationirungspunkte, welche in den wenigsten Fällen mit Bogenpunkten zusammentreffen, müssen die Abscissen und Ordinatenlängen durch Interpolation bestimmt werden.

Unvollkommene Hülfsmittel zum Abstecken der Ordinaten bedingen, wenn deren Längen zu gross werden, die successive Anlegung von neuen Tangentenabscissen, wofür sich in den Tafeln jeder Bogenlänge entsprechend die Secantes externae angegeben finden. Dieselben werden, der jeweiligen Bogenlänge entsprechend, im Berührungs punkte der Tangente, von der ausgegangen wurde, senkrecht auf dieselbe angelegt, der Endpunkt mit dem Curvenpunkt verbunden und so die neue Tangentenabscisse bestimmt.

Berechnet wurden die Tafeln nach folgenden Formeln, welche leicht abzuleiten sind:

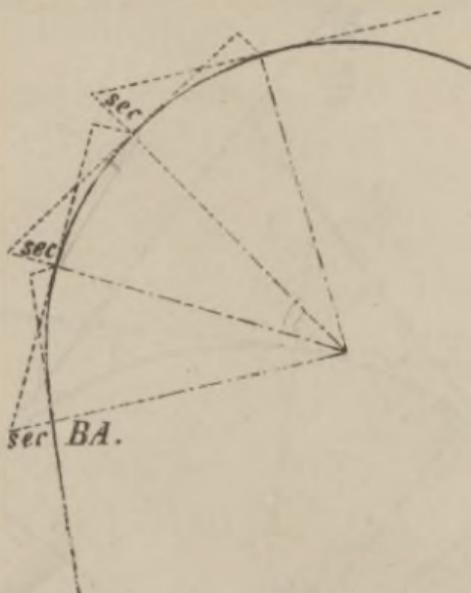

$$\text{Abscissen} = R \sin \alpha$$

$$\text{Ordinaten} = R(1 - \cos \alpha) = R \sin \text{vers} \alpha$$

$$\text{Sec. ext.} = R(\sec \alpha - 1).$$

Der Winkel  $\alpha$  entspricht jeweilig der angenommenen Bogenlänge.

Um schnell und genau nach dieser Methode in Fällen abzustecken, da die Anlegung von längeren Tangenten nicht thunlich ist, wird nach folgender Figur verfahren.

Die der abzusteckenden Bogenlänge entsprechende Abscisse wird auf der Tangente abgemessen, die Ordinate darauf errichtet und der erste Bogenpunkt bestimmt. Dann wird im Tangentberührungs punkte die Sec. ext. senkrecht auf die Tangente angelegt und der Endpunkt der Sec. ext. mit dem schon bestimmten ersten Bogenpunkte verbunden und auf diese Weise die Richtung der zweiten Tangentenabsisse bestimmt. Anf dieser wird wieder eine Abscissenlänge abgemessen u. s. f.

Die Coordinatenabsteckungsmethode ist fast ausschliesslich in Frankreich im Gebrauch.

## **Tafeln**

zur annähernd richtigen, schnellen Absteckung von Curven  
nach der Methode der successiven Sehnen für Radien  
zwischen 100 und 5000 Masseinheiten.

---

Die Tangente bei Bogenanfang wird als gegeben vorausgesetzt. Auf dieser wird nun die der abzusteckenden Bogenlänge entsprechende Entfernung aufgetragen und bei  $A$  die Ordinate 0 angelegt und zwar so, dass deren Endpunkt 1 von Bogenanfang um die abzusteckende Bogenlänge ent-

fernt ist. Im freien Terrain wird einfach mit der Messkette mit dem einen Kettenstab in Bogenanfang als Centrum ein Bogen von  $A$  bis 1, also bis zum Endpunkte der Ordinate beschrieben. Ist Punkt 1 bestimmt, wird die Sehne, Bogenanfang Punkt 1, über 1 hinaus verlängert, wieder die abzusteckende Bogenlänge darauf von 1 hinaus

abgemessen, Punkt  $B$  bestimmt, mit der Kette ein Bogen um 1 als Centrum beschrieben, mit der Ordinate  $B$  2 von  $B$  aus ein Bogen beschrieben, wo sich die beiden Bogen schneiden, liegt Punkt 2 der Curve u. s. f.

Unter der Voraussetzung, dass die abzusteckenden Bogenlängen mit den abgesteckten Sehnenlängen übereinstimmen, was eben nur annähernd richtig ist, finden wir aus der Aehnlichkeit der Dreiecke  $B$  2 1 und  $2 C 1$ : Ordinate  $B$  2 : Sehne 1 2 = Sehne 1 2 : Radius  $C$  2 und hieraus

$$\text{Ordinate } B 2 = 2 O = \frac{\text{Sehne}^2}{\text{Radius}} = \frac{\text{Bogenlänge}^2}{\text{Radius}}$$

Die erste Ordinate bei diesem Verfahren  $O = \frac{\text{Bogenlänge}^2}{2 \text{Radius}}$   
Sämmtliche Ordinaten nach Absteckung der ersten Bogen-  
länge sind immer gleich  $2 O = \frac{\text{Bogenlänge}^2}{\text{Radius}}$  zu nehmen.

Um schliesslich an einem beliebigen Curven-Punkte die Richtung der Tangente zu erhalten, hat man blos im vorhergehenden Curvenpunkt die Anfangsordinate  $\frac{\text{Bogenlänge}^2}{2 \text{Radius}}$  anzulegen und Endpunkt der Ordinate mit dem Curvenpunkte zu verbinden.

Diese Methode zeichnet sich durch leichte, schnelle Handhabung aus, ist nur annähernd richtig, z. B. aber im Walde etc. unter Umständen mit Vortheil anwendbar. Sie ist um so genauer, je grösser der Radius ist und je kleiner die Bogenlänge angenommen wird. In Amerika und England ist sie allgemein im Gebrauch.

| Radius | Bogenlänge | Bogenlänge <sup>2</sup> |                       |
|--------|------------|-------------------------|-----------------------|
|        |            | 2 Radius                | Radius<br>1. Ordinate |

Die Tafeln sind für alle Maass-Systeme gültig.

## **Gefällswinkel-Tafeln.**

Dieselben dienen zur Reduction von gegebenen Gefällen in entsprechende Winkel und umgekehrt.

Die hierbei berücksichtigten Gefälle sind solche, welche im Eisenbahnbau und Strassenbau am häufigsten verkommen.

---

# 1. Verwandlung von in Bruchform ausgedrückten Gefällen in die denselben entsprechenden Winkel.

Zum Gebrauch bei der Bestimmung von Lage, Distanz und Höhe von Terrainpunkten aus ein und demselben Winkel-Instrument-Standort.

Aus Stampfer's „Anleitung zum Nivelliren“ pag. 85, 86, 87 und 88 und aus Stambach's „Der topogr. Distanzmesser“ ist zu ersehen, dass für den gebräuchlichsten Distanzmesser mit je einem verstellbaren Distanzfaden ober- und unterhalb des Mittelfadens bei horizontalem Terrain und bei verticaler Haltung der Nivellirlatte, welche gewöhnliche Masstheilung besitzt, die Distanz vom Instrumentstandort bis zum Lattenfusspunkt

$$D = \text{Constante} \times d + F + a.$$

$d$  ist die Ablesung an der Latte, begrenzt von den Visuren durch die beiden Distanzfaden.

$$\text{Constante} = \frac{F}{\delta} = \frac{\text{Brennweite des Objectivs}}{\text{Entfern. der Distanzfaden im Fernrohr.}}$$

$a$  ist gewöhnlich  $= \frac{F}{2}$  zu setzen, weil Abstand von Fernrohraxe und Objectiv gewöhnlich gleich halber Objectivbrennweite.

$$\text{Also } D = \text{Constante} \times d + 1,5 F.$$

Die Constante wird am besten  $= 100$  angenommen, so dass einer Ablesung von z. B.  $1^m$  an der Nivellirlatte folgende Distanz entspricht:

$$D = 100^m + 1,5 F.$$

Einer Ablesung von  $1,5^m$  entspricht

$$D = 150^m + 1,5 F \text{ etc.}$$

Die Brennweite des Objectivs wird erhalten, indem man das Fernrohr auf einen weit entfernten Gegenstand einstellt und das Ocular um soviel hin und her verschiebt, bis Bild und Fadenkreuz zugleich deutlich erscheinen.

Abstand von Fadenkreuz bis Mitte Objectiv gibt die gesuchte Brennweite.

Ist das Terrain nicht horizontal, findet man bei verticaler Haltung der Nivellirlatte durch den Gehülfen, welche Haltung am besten durch eine an der Latte angebrachte Libelle bestimmt wird, durch die Ablesung des Lattenabschnittes nicht die horizontalen, sondern die schießen Distanzen von Instrument bis Latte. Diese müssen auf den

Horizont reducirt werden, und erhält man bei Ablesung des Neigungswinkels  $\alpha$  folgende Formeln:

$$D = 100 d \cos^2 \alpha + 1,5 F = 100 d - 100 d \sin^2 \alpha + 1,5 F.$$

$$\text{Oder 1)} D = 100 d + 1,5 F - 100 d \sin^2 \alpha$$

Die Tafel, welche wir nach Stampfer, übereinstimmend mit einem Schema von Prof. Wild in Zürich, gerechnet haben, giebt die Grössen  $100 \sin^2 \alpha$  an.

Für die Höhendifferenz zwischen Instrumentstandort und Lattenfusspunkt haben wir

$$2) H = D \operatorname{tg} \alpha,$$

wobei  $D$  aus Gleichung 1 zu entnehmen ist und der Mittelfaden des Fernrohrs auf dieselbe Höhe der Nivellirplatte eingerichtet sein muss, um welche Fernrohraxe und Terrainpunkt von einander abzustehen. z. B.

$$\text{Lattenablesung } d = 1^m 8$$

$$F = 0^m 3$$

$$\angle \alpha = 6^{\circ} 40'$$

$$\begin{aligned} D &= 100 \times 1,8 + 1,5 \times 0,3 - 100 \times 1,8 \sin^2 6^{\circ} 40' \\ &= 180 + 0,45 - 1,8 \times 1,4 \\ &= 177,93 \end{aligned}$$

ferner:

$$H = 177,93 \operatorname{tg} 6^{\circ} 40' = 177,93 \times 0,117 = 20^m 82.$$

Unger & Gauert

Fernspr. 359 Schweidnitz Friedrichstr. 2

Verlag von **Wilhelm Ernst & Sohn** in Berlin W 66  
Wilhelmstraße 90.

**Bestimmungen für die Aufstellung der techn. Vorarbeiten zu Eisenbahn-Anlagen. (Amtlich.)** Zwei Tafeln gr. Folio nebst Text in Reichsformat. 1871. 12 M.

**Boerner, F.,** Statische Tabellen. Belastungsangaben und Formeln zur Aufstellung von Berechnungen für Baukonstruktionen. Mit 399 Abb. Fünfte neubearbeitete Aufl. 1915. geb. 4,40 M.

**Beiträge zur zeichnerischen Massenermittlung, Massenverteilung und Förderkostenbestimmung der Erdarbeiten.** Von Dr.-Ing. Dipl. Ing. R. Schütz, Regierungsbauführer.

Mit 32 Abb. u. 3 Tafeln. 1908. geh. 2,40 M.

**Vorschriften für die Aufstellung von Fluchtlinien und Bebauungsplänen vom 28. Mai 1876** nebst dem Gesetze vom 2. Juli 1875, betreffend die Anlegung von Straßen und Plätzen in Städten und ländlichen Ortschaften.

Hierzu ein farbiges, in der Plankammer des Ministeriums der öffentlichen Arbeiten bearbeitetes Musterblatt. Dritte Aufl. 1908. In Mappe 4,50 M.

**Erddruck, Erdwiderstand und Tragfähigkeit des Baugrundes in größerer Tiefe.** Praktische Beispiele. Von H. Krey, Reg.- u. Baurat.

Mit 32 Textabb. 1912. geh. 2 M.

**Kurze Anleitung für die Bauüberwachung eiserner Brücken.** Von G. Schaper, Regierungsbaumeister. Mit 11 Textabb. 1912. geh. 1,50 M.

**Die Berechnung des Eisenbahn-Oberbaues.** Von Dr. H. Zimmermann, Geh. Oberbaurat. Mit 118 Holzschnitten, 12 lithogr. Tafeln in Mappe. 1888.

geh. 20 M., geb. 22 M.

**Rechentafel nach den gesetzlich vorgeschriebenen Zahlenwerten.** Von Geh. Oberbaurat. Ausgabe 1913. Wirkl.
